

We Claim:

1. A juicer, comprising:

an electromotor having at least two driving speeds;

a first switch connected to said electromotor;

a second switch connected to said electromotor;

a centrally disposed element projecting upward in a taper for pressing a piece of fruit; and

said electromotor being operatively connected to said element and rotationally driving said element:

at a first speed upon actuation of said first switch; and

at a second speed greater than said first speed upon actuation of said second switch.

2. The juicer according to claim 1, further comprising a button connected to said second switch and switching said second switch upon actuation of said button.

3. The juicer according to claim 1, further comprising a button, said second switch being switchable by said button.

4. The juicer according to claim 1, wherein said second switch is a button.

5. The juicer according to claim 1, wherein:

said first switch has an off state and an on state; and

said second switch can be actuated only if said first switch is in said on state.

6. The juicer according to claim 1, wherein said second switch is operatively connected to said first switch and is actuated only if said first switch is on.

7. The juicer according to claim 1, wherein:

said first switch has an off state and an on state; and

said second switch is operatively connected to said first switch and is actuated only if said first switch is in said on state.

8. The juicer according to claim 2, further comprising a housing wall, said button being disposed on said housing wall.

9. The juicer according to claim 3, further comprising a housing wall, said button being disposed on said housing wall.

10. The juicer according to claim 4, further comprising a housing wall, said button being disposed on said housing wall.

11. A juicer, comprising:

an electromotor having at least two driving speeds;

a first switch connected to said electromotor and switching said electromotor to a first driving speed;

a second switch connected to said electromotor and switching said electromotor to a second driving speed greater than said first driving speed;

a centrally disposed element projecting upward in a taper for pressing a piece of fruit; and

said electromotor being operatively connected to said element and rotationally driving said element:

at said first driving speed upon actuation of said first switch; and

at said second driving speed upon actuation of said second switch.

12. The juicer according to claim 11, further comprising a button connected to said second switch and switching said second switch upon actuation of said button.

13. The juicer according to claim 11, further comprising a button, said second switch being switchable by said button.

14. The juicer according to claim 11, wherein said second switch is a button.

15. The juicer according to claim 11, wherein:

said first switch has an off state and an on state; and

said second switch can be actuated only if said first switch is in said on state.

16. The juicer according to claim 11, wherein said second switch is operatively connected to said first switch and is actuated only if said first switch is on.

17. The juicer according to claim 11, wherein:

said first switch has an off state and an on state; and

said second switch is operatively connected to said first switch and is actuated only if said first switch is in said on state.

18. The juicer according to claim 12, further comprising a housing wall, said button being disposed on said housing wall.

19. The juicer according to claim 13, further comprising a housing wall, said button being disposed on said housing wall.

20. The juicer according to claim 14, further comprising a housing wall, said button being disposed on said housing wall.

21. A juicer, comprising:

an electromotor having at least two driving speeds;

a first means for switching said electromotor to a first rotational speed;

a second means for switching said electromotor to a second rotational speed greater than said first rotational speed;

a centrally disposed element projecting upward in a taper for pressing a piece of fruit; and

said electromotor being operatively connected to said element and rotationally driving said element:

at said first rotational speed upon actuation of said first switching means; and

at said second rotational speed upon actuation of said second switching means.
